

Problem Statement Alignment

Problem Requirement	SmartSched AI Solution
Machine Availability	Tracks machine status and available capacity
Processing & Setup Time	Includes operation and setup durations in scheduling
Order Priority	Prioritizes critical and high-priority orders
Deadlines	Optimizes schedules to reduce late deliveries
Workforce Availability	Considers available workers during scheduling
Material Availability	Checks material constraints before assigning jobs
Machine Downtime	Detects simulated failures and removes affected capacity
Production Cost	Considers cost while generating schedules
Changing Conditions	Virtual factory simulates real-time disruptions
Re-optimization	Automatically generates a revised feasible schedule
Decision Support	Dashboard shows schedule changes and their impact

SmartSched AI transforms static production planning into adaptive scheduling by continuously responding to machine, material, workforce and order uncertainties.
